

# Everything you need to know about the **NBN** & your Intruder Alarm Systems

[www.crownsecurity.com.au](http://www.crownsecurity.com.au)

The National Broadband Network (nbn) has been rolled across Perth, and you may be eligible to take advantage!

## What is the NBN?

In a nut shell the NBN rollout replaces the existing copper telephone lines with fibre optic cabling. The primary benefit is far **greater 'speed plans' for internet access**, which makes web browsing, video streaming (Netflix), and home technology (wireless security & other tech) more seamless.

## How will this affect your intruder alarm system?

The rollout of the nbn within your area will leave your home or business with no conventional "copper cable" phone line. Without a fixed-line telephone, your monitored intruder alarm system will not dial out, which means that any alarm system downtime will go unnoticed, **leaving your home vulnerable to intruders.**

## How to avoid alarm system vulnerability

### The quick fix

One solution that is not advised is to speak with your internet service provider and request a "fibre phone line", which may require rewiring your home or business to the new NBN main connection. This is not advised as in the event of total power failure, any alarm system downtime will go unnoticed, also leaving your home vulnerable to intruders.

### The BEST way!

If you want to have confidence in the security of your home, **the only solution is installing a GPRS communicator.** This small device can be fitted to any intruder alarm system that communicates via a standard telephone line. It fits in with your existing system, is connected to the panels power source(s) and links with your internal telephone connection.

## Here are the benefits of the GPRS Communicator

1. **Retrofit** your existing intruder alarm system
2. Save on existing telephone line rental costs
3. The Communicator is **compatible** with all intruder alarm panels that communicate via telephone lines
4. **No more** telephone calls on your **phone bill** from the alarm panel
5. **Added security** as existing telephone lines can be compromised if they are cut outside of the premises. This device is wireless and so tampering is extremely difficult
6. It's **portable!** If you relocate, you can take the device with you to your new home or business premises
7. This **device will communicate all alarm conditions.** So you will **send all signals at no additional cost.**

## The Savings!

**Low Installation Cost** From \$379 fully installed

**Home Owners** Could Save Over \$445.00 per year

**Business Owners** Could Save Over \$538.00 per year
